

Using your GlobeScope Collection DVD

To use the clips on a GlobeScope DVD-ROM you will need **Quick Time** on your computer. If you do not have QuickTime, you may download it from: <http://www.apple.com>,

The GlobeScope video clips on DVD-ROMs can be imported into most non-linear editing programs for Macs and PCs. The clips are broadcast quality **QuickTime** movie files slightly compressed using the Photo JPEG .mov file type. (NTSC, 720 x 486 pixels, 30 frames per second). The clips are too large to play smoothly on many desktops. To play well, a clip should be imported into a non-linear editing program such as Adobe Premier, Adobe Premier Pro, Avid, Avid Express, Pinnacle, Final Cut Pro, or i-Movie 4 or later.

If you are editing with an i-Movie program that predates the version included with i-Life 4, you will need to upgrade to i-Life 4. This will automatically convert the .mov clips on this disk into the .dv clips used by i-Movie. To upgrade go to <http://www.apple.com>, and be sure to check your computer configuration with the listed system requirements.

If, after meeting the basic requirements listed above you continue having problems using clips in the **GlobeScope** collection you may return the DVD-ROM to Allied-Vaughn, ATTN: Dean Cazal, 1434 NW 17th Avenue, Portland, OR 97209 with a request that it be replaced with the same collection on a mini-DV tape. For reference to the clips, you may then download the pdf index file for the collection from the GlobeScope web site.
